# Nation's Uninsured Rate for Children Drops to Another Historic Low in 2016 

 by Joan Alker and Olivia PhamThe number of uninsured children nationwide dropped to another historic low in 2016 with approximately 250,000 children gaining coverage that year, according to newly available data from the U.S. Census Bureau. Nationally, 95.5 percent of children had health insurance in 2016, up from 95.2 percent in 2015, a significant improvement. As the figure on page 2 shows, the uninsured rate has been cut by nearly half since 2009.

The progress was widespread across the nation with 16 states seeing a decline in the rate of uninsured children from 2015 to 2016, 34 states holding steady, and only the District of Columbia seeing an increase in the rate of uninsured children. (See Appendix Table 2.)

Twenty-seven states had uninsured rates for children lower than the national average of 4.5 percent and 12 states had rates significantly higher than the national average. The six states with the highest rates of uninsured children in 2016 were Alaska, Texas, Wyoming, North Dakota, Oklahoma, and Arizona ranging from 10 percent to 7.3 percent. (See Appendix Table 2.) The states with the greatest number of uninsured children are Texas, California, Florida, Georgia, and Arizona. (See Appendix Table 1.)

## Trends Since Implementation of the Affordable Care Act

Further analysis of the data finds that since the implementation of the major provisions of the Affordable Care Act in 2014, almost 2 million children have gained health insurance. This represents a 37 percent decline in the number of uninsured children. (See Appendix Table 3.) The sharp improvement in children's coverage is a result of more children enrolling in Medicaid and the Children's Health Insurance Program (CHIP) and to a lesser extent new coverage offered through the federal and state-based ACA Marketplace. The Affordable Care Act required states to maintain their income eligibility levels steady for children in Medicaid and CHIP during the examined period.

The vast majority of states (44) have seen significant improvements in their child health coverage rates since 2013. Only one state, Wyoming, has seen its child uninsured rate go up since implementation of the ACA. Five states Alaska, Hawaii, Maine, Nebraska and North Dakota-and the District of Columbia have seen no statistically significant change. (See Appendix Table 4.)

States with the sharpest decline in their rate of uninsured children during the ACA implementation period (from 2013 to 2016) include Nevada, Montana, Florida, Arizona, California, Idaho, and Colorado. (See Appendix Table 4.)

## Conclusion

The share of children covered by employer-sponsored insurance has remained largely unchanged over the threeyear period, while all forms of public coverage have had increases in enrollment among children.

The nation continues to make considerable progress in reducing the number of uninsured children, which reached a historic low in 2016. This progress is largely due to enrollment in Medicaid and CHIP.

## Methodology

## Data Source

This brief analyzes single-year estimates of summary data from the 2008 to 2016 American Community Survey (ACS). The U.S. Census Bureau publishes ACS summary data on American Fact Finder. Where only number estimates are available, percent estimates and their standard errors were computed based on formulas provided in the 2016 ACS's "Instructions for Applying Statistical Testing to ACS 1-Year Data."

## Margin of Error

The published Census Bureau data provide a 90 percent margin of error (potential error bounds for any given data point). Except where noted, reported differences of rate or number estimates (either between groups, coverage sources, or years) are statistically significant within a 90 percent margin of error. Georgetown CCF does not take the 90 percent margin of error into account when ranking states by the number and percent of uninsured children by state. Minor differences in state rankings may not be statistically significant.

## Percent Change

Percent change measures differences relative to the size of what is being measured. Percent change is useful in assessing a state's progress in reducing its population of uninsured children by comparing the decline to the size of the population at the starting point. In this report, percent change refers to change in uninsured children from 2013 to 2016, or 2015 to 2016, compared to the original population of uninsured children in 2013 and 2015, respectively.

## Geographic Location

We report regional data for the U.S. as defined by the Census Bureau. The ACS produces single-year estimates for all geographic areas with a population of 65,000 or more, which includes all regions, states (including DC), and county and county equivalents.

## Health Coverage

Data on sources of health insurance coverage are point-intime estimates that convey whether a person has coverage at the time of the survey. Individuals can report more than one source of coverage, so such totals may add to more than 100 percent. Additionally, the estimates are not adjusted to address the Medicaid undercount often found in surveys, which may be accentuated by the absence of state-specific health insurance program names in the ACS. We report children covered by Medicare, TRICARE/ military, VA, or two or more types of health insurance as being covered by an "other" source of health coverage. The Census Bureau provides the following categories of coverage for respondents to indicate source of health insurance: current or former employer, purchased directly from an insurance company, Medicare, Medicaid or meanstested (includes CHIP), TRICARE or other military health coverage, VA, Indian Health Service (IHS), or other. People who indicate IHS as their only source of health coverage do not have comprehensive coverage and are considered to be uninsured.

## Demographic Characteristics

"Children" are defined as those under the age of 18 .

Appendix Table 1. Change in the Number of Uninsured Children, 2015 to 2016

| State | 2015 Number Uninsured | 2016 Number Uninsured | 2015-2016 Change in Number Uninsured |  | Percent Change |
| :---: | :---: | :---: | :---: | :---: | :---: |
| United States | 3,534,000 | 3,277,000 | -257,000 | * | -7.3\% |
| California | 302,000 | 268,000 | -34,000 | * | -11.3\% |
